INTEGRATED CIRCUITS

Product specification File under Integrated Circuits, IC06 December 1990

FEATURES

- Low "ON" resistance: 80Ω (typ.) at V_{CC} - V_{EE} = 4.5 V 70Ω (typ.) at V_{CC} - V_{EE} = 6.0 V 60Ω (typ.) at V_{CC} - V_{EE} = 9.0 V
- Logic level translation: to enable 5 V logic to communicate with ± 5 V analog signals
- Typical "break before make" built in
- Output capability: non-standard
- I_{CC} category: MSI

GENERAL DESCRIPTION

The 74HC/HCT4053 are high-speed Si-gate CMOS devices and are pin compatible with the "4053" of the "4000B" series. They are specified in compliance with JEDEC standard no. 7A.

QUICK REFERENCE DATA

 $V_{EE} = GND = 0 V; T_{amb} = 25 °C; t_r = t_f = 6 ns$

The 74HC/HCT4053 are triple 2-channel analog multiplexers/demultiplexers with a common enable input (\overline{E}) . Each multiplexer/demultiplexer has two independent inputs/outputs (nY₀ and nY₁), a common input/output (nZ) and three digital select inputs (S₁ to S₃).

With \overline{E} LOW, one of the two switches is selected (low impedance ON-state) by S₁ to S₃. With \overline{E} HIGH, all switches are in the high impedance OFF-state, independent of S₁ to S₃.

 V_{CC} and GND are the supply voltage pins for the digital control inputs (S₁, to S₃, and \overline{E}). The V_{CC} to GND ranges are 2.0 to 10.0 V for HC and 4.5 to 5.5 V for HCT. The analog inputs/outputs (nY₀ and nY₁, and nZ) can swing between V_{CC} as a positive limit and V_{EE} as a negative limit. $V_{CC} - V_{EE}$ may not exceed 10.0 V.

For operation as a digital multiplexer/demultiplexer, V_{EE} is connected to GND (typically ground).

| CVMDOI | | CONDITIONS | TYP | | |

Notes

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μW):

 $P_{D} = C_{PD} \times V_{CC}^{2} \times f_{i} + \sum \{(C_{L} + C_{S}) \times V_{CC}^{2} \times f_{o}\} \text{ where:}$

 f_i = input frequency in MHz; f_o = output frequency in MHz

 $\Sigma \{(C_L+C_S) \times V_{CC}^2 \times f_o\} = sum of outputs$

 C_L = output load capacitance in pF; C_S = max. switch capacitance in pF

V_{CC} = supply voltage in V

2. For HC the condition is $V_1 = GND$ to V_{CC} For HCT the condition is $V_1 = GND$ to $V_{CC} - 1.5$ V

Note to ratings

To avoid drawing V_{CC} current out of terminals nZ, when switch current flows in terminals nY_n, the voltage drop across the bidirectional switch must not exceed 0.4 V. If the switch current flows into terminals nZ, no V_{CC} current will flow out of terminals nY_n. In this case there is no limit for the voltage drop across the switch, but the voltages at nY_n and nZ may not exceed V_{CC} or V_{EE}.

Notes to the characteristics

- At supply voltages (V_{CC} V_{EE}) approaching 2.0 V the analog switch ON-resistance becomes extremely non-linear. Therefore it is recommended that these devices be used to transmit digital signals only, when using these supply voltages.

Notes to the AC characteristics

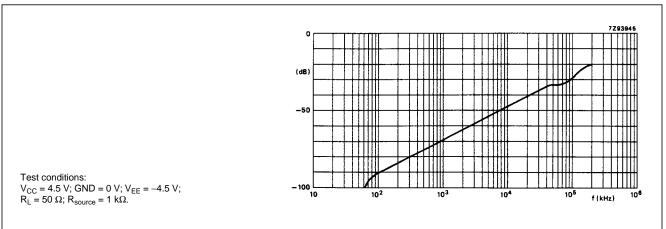

1. Adjust input voltage V_{is} to 0 dBm level (0 dBm = 1 mW into 600 Ω).

2. Adjust input voltage V_{is} to 0 dBm level at V_{OS} for 1 MHz (0 dBm = 1 mW into 50 Ω).

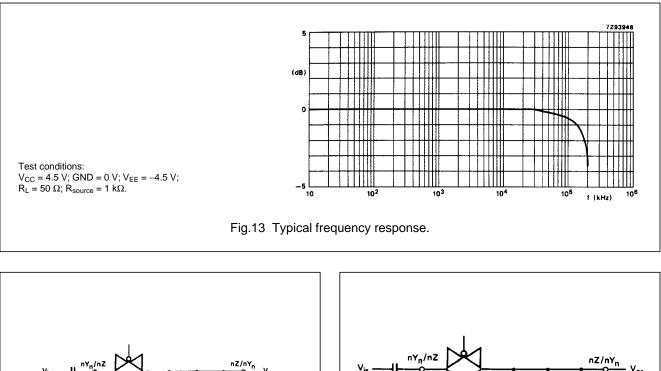

General note

 V_{is} is the input voltage at an nY_n or nZ terminal, whichever is assigned as an input.

 V_{os} is the output voltage at an nY_n or nZ terminal, whichever is assigned as an output

C_L = load capacitance including jig and probe capacitance (see AC CHARACTERISTICS for values).

 R_T = termination resistance should be equal to the output impedance Z_O of the pulse generator.

 t_{r} = t_{f} = 6 ns; when measuring $f_{max},$ there is no constraint to $t_{r},\,t_{f}$ with 50% duty factor.
