**TA7274P****12W BTL AUDIO POWER AMPLIFIER**

The TA7274P is audio power amplifier for consumer application.

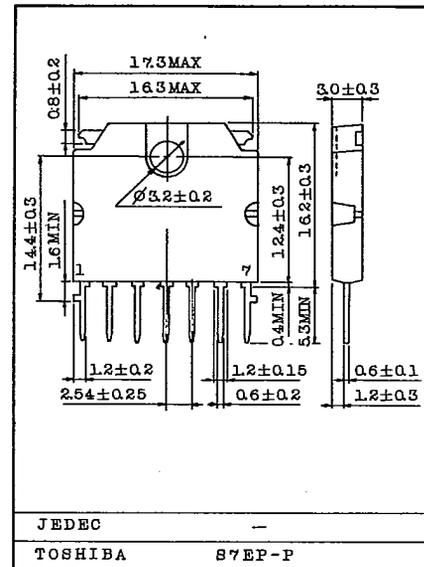

This IC is applying BTL system in which output coupling condenser and bootstrap condenser are not necessary and output 12W ( $V_{CC}=13.2V$ ,  $R_L=4\Omega$ , THD=10%) can be obtained.

Since the package is a 7 pin SIP, (Single Inline Package), it greatly simplifies construction of a power amplifier both in design and assembly.

It also contains various kind of protector. It is suitable for car-audio power amplifier with high performance.

- High Power :  $P_{OUT}=12W(Typ.)$   
( $V_{CC}=13.2V$ ,  $f=1kHz$ , THD=10%,  $R_L=4\Omega$ )
- Built in Protector Circuit  
Thermal Shut Down, Over Voltage Protector (Typ.  $V_{CC}=24V$ )  
ASO Protector ( $R_L$  Short, Out to GND, Out to  $V_{CC}$ )
- Operating Supply Voltage Range :  $V_{CC}=9\sim 18V$

Unit in mm

Weight : 2.19g (TYP.)

**MAXIMUM RATINGS (Ta=25°C)**

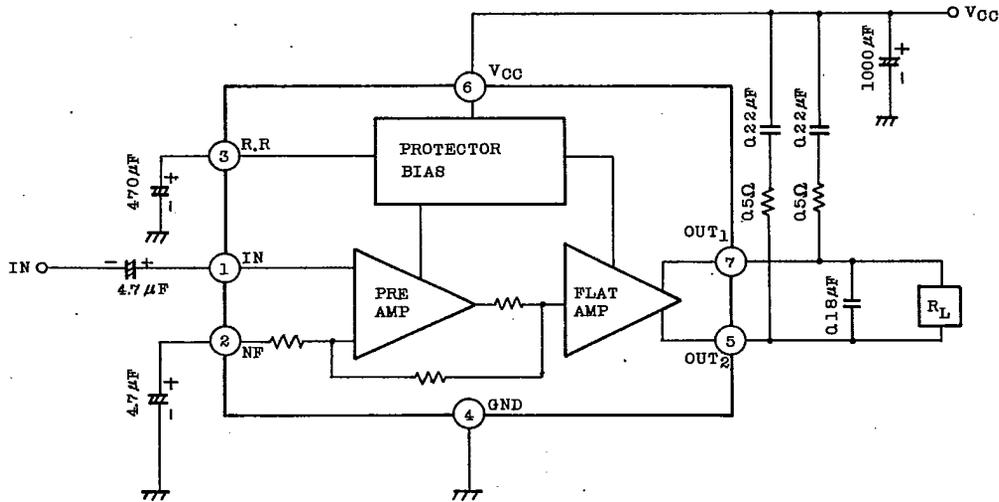

CHARACTERISTIC	SYMBOL	RATING	UNIT
Peak Supply Voltage (0.2 sec)	$V_{CC}$ surge	45	V
DC Supply Voltage	$V_{CC}$ DC	25	V
Operating Supply Voltage	$V_{CC}$ opr	18	V
Output Current (Peak)	$I_O(\text{peak})$	4.5	A
Power Dissipation	PD	15	W
Operating Temperature	$T_{opr}$	-30 ~ 85	°C
Storage Temperature	$T_{stg}$	-55 ~ 150	°C

## TEST CIRCUIT/APPLICATION CIRCUIT

## ELECTRICAL CHARACTERISTICS

(Unless otherwise specified,  $V_{CC}=13.2V$ ,  $R_L=4\Omega$ ,  $f=1kHz$ ,  $T_a=25^\circ C$ )

CHARACTERISTIC	SYMBOL	TEST CIR-CUIT	TEST CONDITION	MIN.	TYP.	MAX.	UNIT
Quiescent Current	$I_{CCQ}$	-	$V_{IN}=0$	-	65	110	mA
Output Power	$P_{OUT}$	-	THD=10%	10	12	-	W
Total Harmonic Distortion	THD	-	$P_{OUT}=5W$	-	0.4	1	%
Voltage Gain	$G_v$	-	$R_f=0\Omega$	51	53	55	dB
Output Noise Voltage	$V_{NO}$	-	$R_g=10k\Omega$ , BW=20Hz ~ 20kHz	-	0.9	2.0	mVrms
Ripple Rejection Ratio	R.R	-	$f_{ripple}=100Hz$ , $R_g=600\Omega$	40	50	-	dB
Input Resistance	$R_{IN}$	-	$f=1kHz$	-	30	-	k $\Omega$
Output Offset Voltage	$V_{offset}$	-	$V_{IN}=0$	-	0	0.3	V

## TYPICAL DC VOLTAGE OF EACH TERMINAL ( $V_{CC}=13.2V$ , $T_a=25^\circ C$ )

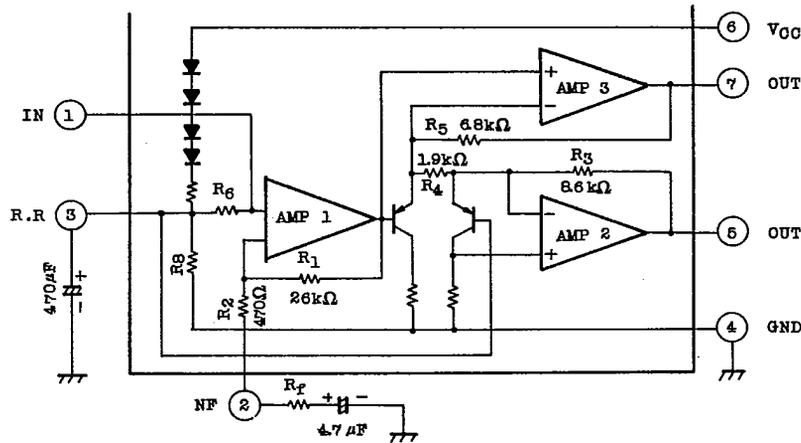

TERMINAL No.	1	2	3	4	5	6	7
DC Voltage (V)	5.4	5.4	5.4	GND	6.6	$V_{CC}$	6.6

## DIRECTIONS FOR USE AND APPLICATION METHOD

(Fig. 1)

### 1. VOLTAGE GAIN ADJUSTMENT

In (Fig. 1), let closed loop voltage gain of initial stage AMP: Amp 1 be  $G_{V1}$ , then

$$G_{V1} \approx 20 \log \frac{R_1}{R_2 + R_f} \text{ (dB)} \quad (R_1 \gg R_2 + R_f)$$

Also, let closed loop voltage gains of non-inverted AMP: Amp 2 and inverted AMP: Amp 3 be  $G_{V2}$  and  $G_{V3}$ , respectively, then,

$$G_{V2} = 20 \log \frac{R_3}{R_4}, \quad G_{V3} = 20 \log \frac{R_4 + R_5}{R_4} \approx 13 \text{ (dB)} \quad (G_{V2} \approx G_{V3}).$$

Hence, the total closed circuit voltage gain  $G_V$  is given by BTL connection as follows:

$$G_V = G_{V1} + G_{V2} + 6 = G_{V1} + 19 \text{ (dB)}.$$

For instance, in the case of  $R_f = 0$ ,  $G_V = 54 \text{ (dB)}$  setting can be made.

When the dead short detecting circuit has operated, a lock condition is realized and the power transistor is protected.

(2) **V<sub>CC</sub>-FAULT PROTECTIVE CIRCUIT** (Circuit between OUT and V<sub>CC</sub> is shorted.)

Block diagram of V<sub>CC</sub>-fault Protective Circuit is shown in (Fig. -3).

This circuit makes a similar operation to the GND-fault protective circuit.

In the case of half-short, the dead-short detecting circuit operates by the rise of output terminal up to V<sub>CC</sub> level, and protects the power transistor.

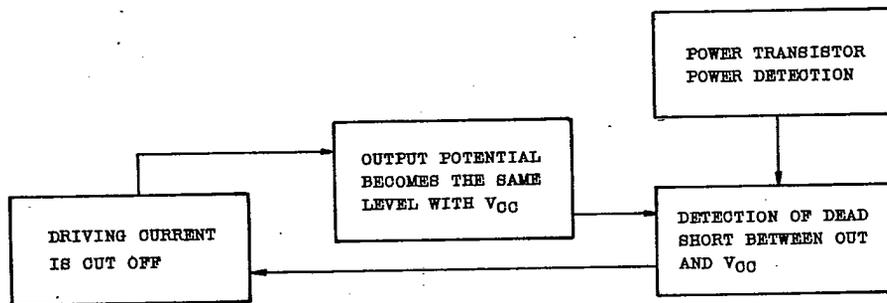

Fig. 3 V<sub>CC</sub> FAULT PROTECTIVE CIRCUIT

(3) **R<sub>L</sub> SHORT PROTECTIVE CIRCUIT** (Circuit between OUT and OUT is shorted.)

It cuts off driving current by the power transistor power detecting circuit of GND-fault and V<sub>CC</sub> fault, protective circuit, and protects the power transistor.

### 3. OSCILLATION PREVENTION

In this IC, GND pin [(4) pin] has only one terminal, and the inside of IC is divided by into Pre-GND and Power-GND. For this reason, pay attention to the following points in making design.

- (1) Install the chemical condenser between VCC and GND near IC pin as much as possible.
- (2) Drop heat sink to ((4) Pin) GND. (To prevent the deterioration of distortion.)
- (3) Use oscillation preventive condenser between output VCC, characteristic of which is not so much affected by temperature. When using ceramic condenser, adopt the value larger than the recommended value, as the characteristic of ceramic condenser is apt to be changed by temperature.

In this case, never fail to execute temperature test and check oscillation allowance.

**TOSHIBA**

**TA7274P**

T-74-05-01

Recommended oscillation stopping condenser capacity and series resistance value is  $0.22\mu\text{F}$  and  $0.5\Omega$ , respectively.

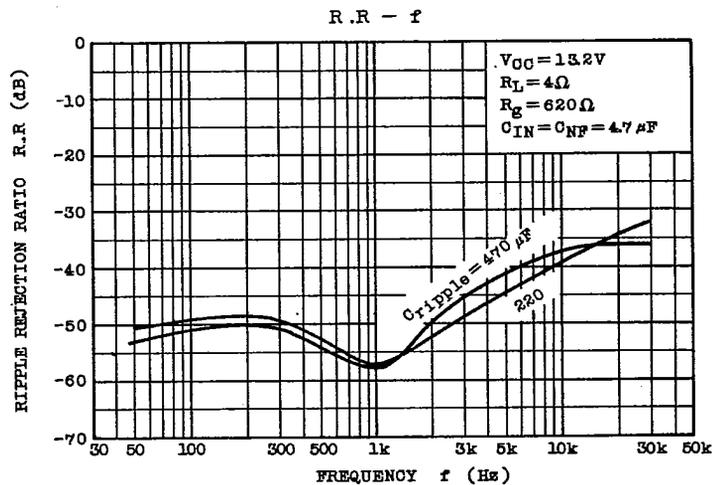

Before using, fully examine the type and mounting position of condenser.

There is a possibility of oscillation when contact resistance is produced by the use of IC socket.

#### (4) CAPACITY VALUE OF CHEMICAL CONDENSER

When the values of input coupling and NF condenser are different, pop Noise is produce. Therefore, it is recommended, to equalize the capacity values and adopt  $4.7\mu\text{F}$ .

(Fig. -5) shows the characteristic when the capacity of ripple condenser is varied.
