For further marking information, please see special data sheet "Chip resistors marking".

## CONSTRUCTION

The resistors are constructed out of a high-grade ceramic body. Internal metal electrodes are added at each end and connected by a resistive paste. The composition of the paste is adjusted to give the approximate required resistance and laser cutting of this resistive layer that achieves tolerance trims the value. The resistive layer is covered with a protective coat and printed with the resistance value. Finally, the two external terminations (matte tin) are added. See fig. 4.

## FUNCTIONAL DESCRIPTION

## OPERATINGTEMPERATURE RANGE

Normal Power: Range: $-55^{\circ} \mathrm{C}$ to $+155^{\circ} \mathrm{C}$ (Fig. 5)
Double Power: Range: $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ (Fig. 6)

## POWER RATING

Each type rated power at $70^{\circ} \mathrm{C}$ :
RL0402=I/I6 W;
RL0603=I/IO W;
RL0805=1/8 W, I/4W;
RLI 206=1/4 W, I/2W;
RLI $210=1 / 2 \mathrm{~W}$;
RLI218=1 W;
RL2010=3/4 W;
RL25I2=I W.

## Rated voltage

The DC or AC (rms) continuous working voltage corresponding to the rated power is determined by the following formula:
$V=\sqrt{(P \times R)}$
Where
$\mathrm{V}=$ Continuous rated DC or AC (rms) working voltage (V)

P = Rated power (W)
$R=$ Resistance value $(\Omega)$
